(54) Title: METHOD FOR DETERMINING THE THREE-DIMENSIONAL SURFACE OF AN OBJECT

(57) Abstract: The present invention refers to a method for determining the threedimensional surface of an object. In an embodiment thereof the method for determining the three-dimensional surface of an object comprises the phases of: defining (1) the coordinates of a plurality of points of said object; defining (2) a three-dimensional matrix of cells that contains said object to which a value can be associated; determining (3) the distance between each centre of said cells of said three-dimensional matrix of cells and the closest point of said plurality of points of said object; setting (4) the value of several cells of said three-dimensional matrix of cells at a first preset value; determining (7) the value that each cell of said three-dimensional matrix of cells assumes, with the exception of said several cells, by means of the following formula (I). Where formula (Ia) represents the coordinates of the centre of the  $i$ -th cell, formula (Ib) represents the value of the  $i$ -th cell at time  $t$ ,  $v_i$  represents said distance,  $w$  represents a second preset value, and  $j$  indicates a neighbourhood of cells of the  $i$ -th cell; determining (9) the sum in module of the variations of the value of each cell between the time  $t$  and the time  $t+1$ ; repeating (10) said phase of determining the value that each cell of said three-dimensional matrix of cells assumes if said sum is greater than a third preset value.
